HBSC

Health Behaviour in School-aged Children survey

This is an international survey being conducted every four years since 1982 under the auspices of the European office of the World Health Organisation (WHO). Currently, over 41 countries (including France since 2002) or regions, mainly in Europe, take part and collect standardised information on behaviours that are detrimental to or positive for health in students aged 11, 13 and 15 years. The HBSC survey is self-administered, strictly anonymous and conducted in class under the supervision of a specially trained investigator.

From April to June 2014, 10,434 school-age students from the last year of primary school to the first year of high school were surveyed in public or private establishments in mainland France under contract with the French national education authority.

Results

Alcohol, tobacco and cannabis use during "the collège years" in 2014

[Tendances n° 106, December 2015](#)

Alcohol, tobacco and cannabis during the « collège years »

[Tendances n° 80, April 2012](#)

Tobacco, alcohol and cannabis consumption during early adolescence - Results from the French section of the 2006 HBSC survey

[Tendances N° 59, March 2008](#)
